MINTE OF CHAR-2000) to the EMBL/GenBank/DDBJ databases.

MINTERON: This is one of the several different receptors for 5-hydroxytryptamine (serotonin), a biogenic hormone that functions as a neurotransmitter, a hormone, and a mitogen. The activity of this receptor is mediated by G proteins that inhibit adenylate cyclase activity (By similarity).

MINTERIAR LOCATION: Integral membrane protein.

PIN: Phosphorylated, and palmitcylated. Desensitization of the receptor may be mediated by its phosphorylation (By similarity). SIMILARITY: Belongs to family 1 of G-protein coupled receptors.

Strongest to the other 5HT-1 subtype receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            6 (POTENTIAL).

-!- FUNCTION: This is one of the several different receptors for 5-
hydroxytryptamine (seronin), a biogenic hormone that functions
as a neurotransmitter, a hormone, and a mitogen. The activity of
this receptor is mediated by G proteins that inhibit adenylate
                                                                                                                                                                                                                                                                                                                                                                                                                                       cyclase activity.
SUBCELIOLAR LOCATION: Integral membrane protein.
SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
Strongest to the other 5HT-1 subtype receptors.
                                                                                                                                                                                                                              Cavia porcellus (Guinea pig).

Pharmacol. 354:237-244(1996).

-!- FUNCTION: This is one of the several different receptors for 5-hydroxytryptamine (serotonin), a biogenic hormone that functions as a neurotransmitter, a hormone, and a mitogen. The activity of this receptor is mediated by G proteins that inhibit adenylate cyclase activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Harwood G.S., Lockyer M., Giles H., Fairweather N.; "Cloning and characterisation of the rabbit 5-HIID alpha and 5-HIID
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SUBCELLULAR LOCATION: Integral membrane protein. SIMILARITY: Belongs to family 1 of G-protein coupled receptors. Strongest to the other 5HT-1 subtype receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SEQUENCE FROM N.A.

-!- FUNCTION: This is one of the several different receptors for 5-hydroxytryptamine (serotonin), a biogenic hormone that functions as a neurotransmitter, a hormone, and a mitogen. The activity of this receptor is mediated by G proteins which activate adenylate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SUBCELLULAR LOCATION: Integral membrane protein.
TISSUE SPECIFICITY: Head.
SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PRINTS; PROD0237; GENTHODOPSN.

Mol. Pharmacol. 40:1036-1042(1991)
-!- FUNCTION: This is one of the several different receptors for 5-hydroxytryptamine (serotonin), a biogenic hormone that functions as a neurotransmitter, a hormone, and a mitogen. The activity of this receptor is mediated by G proteins that inhibit adenylate
                                                                                                                                                                                                                                                                                                                                                                                                                                             cyclase activity.
SUBCELLULAR LOCATION: Integral membrane protein.
SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
Strongest to the other 5HT-1 subtype receptors.
                                                              O

Submitted (APR-1995) to the EMBL/Genbank/DDBJ databases.

-!- FUNCTION: This is one of the several different receptors for 5-
hydroxytryptemine (serotonin), a biogenic hormone that functions
as a neurotransmitter, a hormone, and a mitogen. The activity of
this receptor is mediated by G proteins that inhibit adenylate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cyclase activity.
SUBCELLULAR LOCATION: Integral membrane protein.
SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
Strongest to the other 5HT-1 subtype receptors.
                                                                                                                                                                                                                   1070 AACCCCCTGATTTACACAGCTTTTAACAAGAACTACAACAATGCCTTCAAG 1120

                                                 cyclase activity.
SUBCELLULAR LOCATION: Integral membrane protein.
SIMILARITY: Belongs to family 1 of G-protein coupled receptors.
Strongest to the other 5HT-1 subtype receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CYTOPLASMIC (POTENTIAL).

                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes novel human proteins designated NOVX (where X is 1, 2a, 2b, 2c, 2d, 3, 4, 5, 6a, 6b, 7, 8, or 9). NOV1 is a tyrosine-protein kinase 6-like protein; NOV2a-d are keratin 4-like proteins; NOV3 is a collagen-like protein; NOV2a-d are keratin 1-like protein; NOV5 is a serotonin receptor-like protein; NOV6a and NOV65v are cold inducible glycoprotein 30-like protein; NOV7 is a matrilin-2-like protein; NOV9 is a leukocyte surface antigen (CD53)-like protein; and contains a tyrosine kinase-like protein. NOVX sequences have cytostatic, and interprotective activities, and can be used in gene therapy. The NOVX sequences can be used in therapeutics, particularly for treating, preventing or alleviating and human. These disorders include state in a subject, particularly a human. These disorders include cardiomyopathy, atherosclerosis, a disorder related to cell signal correspondences are also useful for determining the presence of or predisposition to a disease associated with altered levels of NOVX controlling useful in therapeutic or prophylactic applications for muchonic and interprotein and in the treatment of the resemble of the controlling of the description or nucleic acid, particularly cancer. The NOVX sequences are also expendent or prophylactic applications for especially useful in therapeutic or prophylactic applications for a disease associated with the treatment of for nucleic acid, particularly cancer. The NOVX sequences are especially useful in therapeutic or prophylactic applications for a disease associated with the treatment of the presence of the process or the pr

The invention relates to isolated human G-protein coupled receptor (GCREC) polypeptides and their biologically active fragments. GCREC and protein is useful in treating a disease or condition associated with an increase or decrease in expression of functional GCREC. The GCREC's are useful in the diagnosis, treatment and prevention of cell proliferative disorders (cancer, leukaemia, melanoma); neurological disorders (stroke, epilepsy, Parkinson's disease, dementia, Alzheimer's disease); autoimmune inflammatory disorder (thyroiditis, haemolytic anaemia, AIDS, multiple solerosis); cardiovascular disorder (atherosclerosis, angina pectoris); gastrointestinal disorder (ulcer, cholelithiasis, gastroenteritis), metabolic disorders (diabetes); viral infections (herpes virus) and in the assessment of the effects of exogenous compounds on the expression of the nucleic acid and amino acid sequences. The present sequence is human

WPI; 2002-383182/41. N-PSDB; ABK71923 New cytoplasmic, nuclear, membrane bound and secreted NOVX polypeptides, useful for treating cancers and tumors, lung disorders, hematopoietic disorders, autoimmune diseases and immune disorders.

Claim 1 ; Page 60; 210pp; English.

The invention relates to an isolated NOVX polypeptide selected from NOV1a, NOV1a, NOV1a, NOV1a, NOV1a, NOV1a, NOV1a, NOV1a, NOV1b, NOV1a, NOV1b, NOV1a, NOV1b, NOV1a, NOV1b, Nov1

ABG60235 standard; protein; 380 AA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The amino acid sequence of the novel rat serotonin receptor MR22. The gene encodes a protein of 370 amino acids. The protein contains 7 crassmenbrane domains (TMDs), a putative N-linked glycosylation site and 4 putative sites for kinase C phosphorylation. Serotonin regulates a wide range of sensory, motor and behavioural functions in the central nervous system (CNS). Serotonin receptors belong to at least two protein superfamilies: G-protein-associated receptors containing 7 TMDs superfamilies: G-protein-associated receptors presented in the patent represent prototypes that fall into three new serotonin subfamily classifications: 5-HT18-like (rat MR77 - AAQ72271 and human MR77 - AAQ72272), 5-HTS (subdivided into 5-HT5alpha, rat REC17 - AAQ7226) and 5-HT5beta, rat MR22 - AAQ72270) and 5-HT6 (rat REC20 - AAQ72273). The genes for the receptors were cloned by amplification based on conserved amino these sequences found in the TMDs. Degenerate primers were constructed to these sequences and used in two rounds of nested PCR amplification on a crat brain hypothalamic cDNA template. In the second round of amplification, degenerate primers corresponding to conserved residues con amplification, degenerate primers corresponding to conserved residues con Nully in indolalmine-binding receptors were used to amplify only those receptors. The resultant fragments were cloned into pBluescribt and their corresponding to obtain itill fangth clones. The nucleic acids and their corresponding to betain a tall thypothalamus and their corresponding to obtain and the second cound a catch their corresponding to obtain who can be a conserved and the conserved amplied and their corresponding to obtain and their conserved and the conserved 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       and their corresponding proteins may be used in methods for determining ligand binding activity, detecting and altering expression of serotonin seceptors, drug screening and therapeutic treatments involving human serotonin receptors. Serotonin receptors are also known to participate in neurological processes. Pathologies including dementia, Parkinson's disease, eating disorders, pathological anxiety, migraine, headaches, insomnia and other conditions. (Updated on 25-MAR-2003 to correct PN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  65 ACCAGCAGCGGACCCGGGACCCCAAGCCCGAGAGGATACTCGGTTCGACCCCGAGCGGC 124

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a series of that increases or decreases the expression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polypeptides, a method for producing a pharmaceutical composition, a method for identifying a compound that regulates its activity of one or more of the polypeptides or their antibodies. The polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more conducted sequence presented in experience presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed or protein in the printed or the sequence data for this patent did not form directly from WIPO at the specification, but was obtained in electronic form directly from wipo in the conduction of the sequence data for the sequence data for the specification of the specification of the sequence data for the specification of the specification of the sequence data for the sequence data for the sequence data for the seque

                                                                                                                                                                                                                                                                                                                                                                                        Oligonucleotides corresponding to conserved regions of known serotonin receptors were used in PCR of mouse brain RNA in presence of reverse transcriptase and the products were sequenced. One product with homology to known receptors was labelled and used to probe a cDNA library in Lambda UniZAP. The 2036 bp sequence AAQ70264 was identified and deduced to encode a protein having 7 hydrophobic domains which represents a novel serotonin receptor which was designated 5HTSD (AAR7066).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to transgenic animals, compositions and methods relating to the characterisation of gene function. The invention also relates to transgenic mice comprising mutations in 5-hydroxy-tryptophan (5-HT)5B receptor gene. The transgenic mice are useful for identifying an agent that modulates the phenotype such as increased depression or increased pain sensitivity. They are also useful for identifying potential therapeutic agents for the treatment of pain or depression and for evaluating a potential therapeutic agent capable of affecting a condition associated with a mutation in a 5-HT5B receptor gene. Transgenic animals of the invention are also useful for testing the efficacy of proposed genetic and pharmacological therapies for human diseases such as neurological, neuropsychological or psychotic illnesses. The present sequence is mouse 5-HT5B receptor protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      124

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel polynucleotide encoding a guanosine triphosphare-binding protein coupled receptor (GPCR). A polynucleotide of the invention may have a use in gene therapy. The polynucleotide and polypeptide are useful for preparing a composition for treating a patient in need of increased or suppressed activity or expression of the guanosine triphosphare-binding protein coupled receptor. The protein sequences shown in ADC85549-ADC87617 represent GPCR's of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ð
                                                                                                                                                              The invention relates to single nucleotide polymorphisms in the gene encoding human 5-hydroxytryptamine (serotonin) receptor 5A (HTR5A). A method for haplotyping the HTR5A gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and etermining whether one of the copies of the gene is defined by one of the HTR5A haplotypes given in the specification or whether both copies are defined by a haplotype pair. This method is useful in genotyping, whereby all possible haplotype pairs can be assigned to specific genotypes. An association between a trial and a haplotype or haplotype or pair of the HTR5A gene can be identified by comparing the frequency of the haplotype pair in a population exhibiting the trait with the haplotype or haplotype frequency in the trait population. Computation, where a higher haplotype frequency in the trait population indicates the trait is associated with the haplotype or haplotype or haplotype and its corresponding DNA are used for studying the expression and function of HTR5A, and in screening for candidate drugs to treat diseases considered to HTRSA activity, such as neurological disorders, including expression and epilepsy. This sequence represents the human HTRSA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          244

New isolated antigenic peptides e.g., for G protein-coupled receptors (PGRS), useful for diagnosing and designing drugs for treating conditions in which GPCRs are involved, e.g. AIDS, Alzheimer's disease, cancer or autoimmune diseases.
                                                                    Disclosure; Fig 1; 523pp; English

The present invention describes antigenic peptides (I) comprising: (a) any one of 1601 sequences (see ABP82019 to ABP83619) of 12-24 amino acids. Also described: (1) an assay for the detection of a particular G protein-coupled receptor (GPCR) or a candidate polypeptide in a sample; and (2) an isolated antibody having high specificity and high affinity or avidity for a particular GPCR. (I) can be used as GPCR modulators and in gene therapy. The antigenic peptides for GPCRs are useful in detecting an antibody against a particular GPCR, and in the production of specific antibody against a particular GPCR, and in the production of specific contribods and antibodies are useful for diagnosing and designing drugs for presence or absence of corresponding GPCRs rule antibodies are useful for diagnosing and designing drugs for GPCRs and antibodies are useful for diagnosing and designing drugs for treating immune-related diseases, immunological-related cell proliferative diseases, or autoimmune diseases, e.g. AlDS, Alzheimer's disease, atherosclerosis, bacterial, fungal, protozcan or viral infections, of seteoporosis, cancer, cardiomyopathy, chronic and acute inflammation, allergies, Crohn's disease, diabetes, graft versus host disease, Parkinson's disease, multiple sclerosis, pain, psoriaeis, anxiety, depression, schizophrenia, dementia, mental retardation, memory loss, epilepsy, asthma, tuberculosis, obesity, nausea, hypertension, hypotension, renal disorders, rheumatoid arthritis, trauma, ulcers, or any other disorder in which GPCRs are involved. The antibodies may be used in immunoassays and immunodiagnosis. ABZ42223 to ABZ42869 encode GPCR proteins given in ABP81675 to ABP82018, which are used in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present relates to a method for identifying a compound for treating urological disorders e.g., urinary incontinence including overactive/ oversensitive bladder, overflow urinary incontinence, stress urinary incontinence caused by dysfunction of the bladder, urethra or central or peripheral nervous system, prostatitis, benign prostatic hyperplasia, cancer of the prostate or kidney disorders. The method is also useful for modulating hyperplasia in a cell and treating a subject having a urological disorder. The invention is also used in gene therapy. The present sequence is human GPCR known as 5-hydroxytryptamine 5A (5-HT-5A) (serotonin receptor)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          304

New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

Claim 1; Page; 1017pp; English

The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a gent to that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially compound for identifying a compound that regulates the activity of one or more of the composition, a method for producing a pharmaceutical composition, a compound that regulates the activity of one or more of the regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating contrivity in an animal of one or more of the polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating to polypeptides or their antibodies. The polynucleotide or the compound that modulates its activity is useful for preparing a medicament for treating conjury (CCI) and spared nerve injury (CMI), in an animal (e.g. spinal segmental nerve injury (MIN)) in an animal (e.g. spinal segmental nerve injury (MIN)) in an animal (e.g. spinal segmental nerve injury (MIN)) in an animal (e.g. spinal segmental nerve injury (MIN)) in an animal (e.g. spinal segmental nerve injury (MIN)) in an animal (e.g. spinal segmental nerve injury (MIN) in an animal (e.g. spinal segmental nerve injury (MIN)) in an animal (e.g. spinal
